HOW-TO

How to post a trading signal

A step-by-step guide for Atlas signal providers — from opening the form to managing a live call and closing it out. Everything your followers see comes from the fields below, so take a minute to fill them in cleanly.

> **Who can post:** posting signals is available on any **paid plan** — Core, Pro, or Elite. On the free plan the button is locked; if you don't see **Post a Signal** on the Signals page, upgrade your plan or ask your admin.

1 Open the Signals page

Log in and open the app. In the left sidebar, click **Signals** (the broadcast icon). This is where all your posted calls live.

2 Click “Post a Signal”

Use the **Post a Signal** button near the top of the Signals page. A form opens where you enter the trade.

3 Fill in the trade details

Complete the fields below. Symbol, entry, stop loss, and at least one target are required — the rest are optional and can be edited later.

Symbol *required*	The instrument, e.g. XAUUSD, EURUSD, BTCUSDT. Typed in capitals automatically.
Market	Commodities, Forex, Crypto, or Stocks. Sets sensible pip/lot defaults.
Order	Pick direction & type: BUY / SELL as Market, Stop, or Limit (6 buttons).
Risk Level	Low, Medium, or High — your read on the setup's risk.
Entry Low *required*	The entry price. For a single price, fill only this field.
Entry High *optional*	Fill this to make the entry a zone (e.g. 4685–4700). Leave blank for a single price.
Stop Loss *required*	Your invalidation level — below entry for a BUY, above entry for a SELL.
Take Profits *1 or more*	Add TP1, TP2, … with “+ Add target” (no limit). Risk:reward is shown per target.
Description *optional*	Your rationale / notes. Can be added or refined later via Edit.
Advanced *optional*	Optional overrides — custom pip size, lot size, and whether to show pip annotations.

4 Post it

Click **Post Signal**. The call goes live on the Signals page and on your public profile, and your followers are notified. If anything is missing, a red message tells you what to fix.

5 Manage it as the trade plays out

On your own signal card you have owner controls:

TP1 / TP2	**Mark a target hit while running.** Tap the TP chips to show a green check on levels price has reached — the signal stays active, so followers see partial progress.
TARGET HIT	**Close as Won.** Pick the take-profit the position closed at — this records the result and R-multiple.
SL	**Close as Lost.** Marks the signal stopped out (–1R).
EDIT / CANCEL	**Adjust or withdraw.** Edit any field (e.g. add the rationale), or cancel a call that's no longer valid.

TIPS FOR CLEAN SIGNALS

- **Entry zone vs single price:** fill both Entry Low and Entry High for a range; leave High blank for one price.
- **Check your stop side:** stop loss goes below entry for a BUY and above entry for a SELL — the preview R:R looks wrong if it's flipped.
- **Ladder your targets:** add TP1, TP2, TP3… so followers can scale out; the per-target R:R updates live.
- **Post first, explain later:** the description is optional at post time — add it through Edit when you have a moment.
- **Mark partial hits** as price reaches each TP to keep your track record honest without closing the trade early.
